

Why Not?

- Markdown is line-oriented, but most compiler technology is structure-oriented
 - { ... { ... } ... }

How?

- Use tiny, tiny steps
- 1. convert .md syntax to intermediate form
 - e.g. “# ... ## ...” to “{ ... { ... } ... }”
- 2. Use PEG (Ohm-JS) to *grok* “{ ... { ... } ... }” and *emit* something else
- 3. Flip code into declaration-before-use format.
