

# Syntactic Noise

- Graphics-only information
  - such as line routing (polylines)
  - (semantics only needs to know beginning and end of lines, the rest is noise)

# Defer Rule Checking

- Check only what is possible on a given diagram
- Leave partially-resolved checking breadcrumbs in “object” format
- “Linker” finishes design checking before instantiating and running a program
- YAGNI — no need to traverse file system to check design rules, linker checks consistency only of what it has been given to run
