

Asides

- “include” is just an edit command (not needed by paradigm / language)
- M4 macro processor can perform including
- “include” should be part of the IDE, not a language feature
- Q: what else is just edit commands? (OO?)

Grasem Tool

- Grasem means grammar+semantics
- simple tool that consumes a single spec and produces a grammar file and glue file
- currently, syntax is ugly but can be fixed by adding more PEG layers
- future: generate glue code from grammar
 - `* / + / ?` suffix \longrightarrow `@` prefix
 - generate one glue rule from every Ohm grammar rule
 - “borrow” Ohm grammar from Ohm source repo to help with the above rewrites
